

High-performance servo motors for SV & Compax drives

Parker HDX and HBMR Series brushless motors are suitable for use with the SV and Compax range of servo drives and controllers. They offer high dynamic performance in a cost-effective package, and with the extensive list of available options they can be tailored to a wide range of applications.

HDX and HBMR motors are three-phase designs using high-energy Samarium Cobalt magnets in a low-inertia rotor. With their high resistance to demagnetisation, these rare-earth magnets allow high acceleration currents to be applied for optimum performance in point-to-point positioning. For contouring applications, the skewed rotor design helps to achieve very smooth rotation over the entire speed range. Optional failsafe holding brakes ensure power-failure security in vertical axes. All motors are fitted with a resolver as standard and in addition have the option of accepting a variety of encoder types.

The robust brushless construction and IP65 enclosure protection (IP64 at the shaft) ensure a long maintenance-free life in all normal industrial environments. Replaceable bearings and seals guarantee extended motor life in arduous applications.

Typical application areas include textile, printing and packaging machines, automatic assembly equipment and general industrial automation.

HDX & HBMR series features

- High-energy Samarium-Cobalt magnets
- Sinusoidal back-EMF
- Peak torque up to 3 times continuous rating
- Maximum speeds up to 8000 rpm
- Skewed stator design for smooth rotation
- Choice of six frame sizes
- Enclosure protection IP65, shaft sealing IP64
- Nitrile shaft seal
- Class F insulation
- Motor connections via terminal box or MS connector
- Integral resolver with MS connector
- Temperature sensors incorporated in windings
- Standard flanges to DIN 42955/IEC72
- All motors available with holding brake option
- Encoder mounting facility
- Extruded aluminium motor body
- Industry-standard keyed shafts
- Alternative shaft styles available
- Matt black paint finish

Options

HDX and HBMR Series motors can be supplied with a number of options as listed below. Please consult your supplier for ordering information.

Holding brake

All motor sizes may be fitted with a holding brake. This is installed behind the motor flange and in most cases does not affect the motor length. The addition of a brake to the HDX55 or HDX70 motors increases the body length by 36mm and 27mm respectively.

The brake must be energised to release and as standard operates from 24V DC. Alternative ratings of 90V AC and 110V AC can be supplied. There is also a high-torque brake available with certain motors.

Encoder mounting flange

If an encoder is required in addition to the integral resolver, a flange is fitted to the rear of the motor and the shaft is extended. An IP65 encoder cover is available.

Rotational tolerance

Motors are normally manufactured to DIN 42999 standard "N" for rotational tolerance (shaft/flange squareness and runout). For more critical applications, for instance when backlash-free gears are fitted, the motor can be supplied with a closer tolerance conforming to DIN standard "R".

Flat shaft

Standard motor shafts have a keyway as detailed in the dimension drawings. A shaft with a machined flat can be supplied as an alternative.

Threaded shaft

A tapped hole can be provided in the end of the shaft with the following dimensions:

HDX55:	M4 x 10	HDX70:	M5 x 10
HDX92:	M5 x 10	HDX115:	M6 x 15
HDX142:	M8 x 15	HBMR190:	M12 x 20

Compax or SV drive type	Motor type	Ref. No.①	Rated speed (rpm)②	Rated torque (Nm)③	Rated current (A rms)	Rated power (kW)	Moment of inertia④ (kg-mm²)	Weight (kg)

This table shows typical motor-drive combinations. The preferred packages are shown in blue and these correspond to the torque-speed graphs on the next page. Details of additional motors and alternative combinations are available on request.

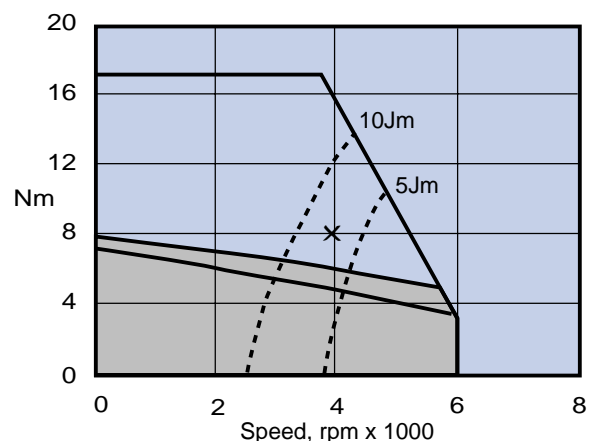

Notes:

- ① The motor characteristics are stored in the Compax & SV drives under this number.
- ② The rated speed is based on a supply voltage 15% below nominal, and allows for 10% variation in drive characteristics and 10% tolerance on motor data.
- ③ Rated torque applies at the rated speed.
- ④ Moment of inertia figures include the feedback resolver. Inertia figures for the optional brake are listed separately.

Power dump safe operating area

In addition to torque-speed data, the performance graphs also give an indication of the safe operating area of the power dump circuit in repetitive start-stop operation. The data is based on a 'worst case' system performing repeated trapezoidal moves with no dwell in between. The time at maximum speed is as short as the thermal rating of the motor will allow. Under these conditions, for any given load inertia, the power in the ballast resistor depends on the peak torque during deceleration and the maximum speed.

The broken lines represent different load inertias as a ratio of the motor inertia J_m . When the application requirements have been calculated, plot the point representing peak torque and maximum speed on the performance graph. If this point lies to the left of the corresponding inertia line, the resistor rating will not be exceeded. If it lies to the right, there is not necessarily a problem but further calculation is required to establish the dump power more accurately - please consult your supplier.

In the example shown, a peak torque of 8Nm and a maximum speed of 4000 rpm are acceptable with a load of 5 times the motor inertia. Note that this information is for general guidance purposes only and will not apply to light duty cycles.

HDX55

Length code	A	C	G
Dimension A (mm)*	122	140	176
Cont. torque (Nm)	0.2	0.4	0.8

*Add 36mm
for brake

Motor cable: MOK15

Resolver cable: REK15

HDX70

Cont. torque (Nm)	11.3	16.0	21.0	25.0

Motor cable: MOK21
Resolver cable: REK14

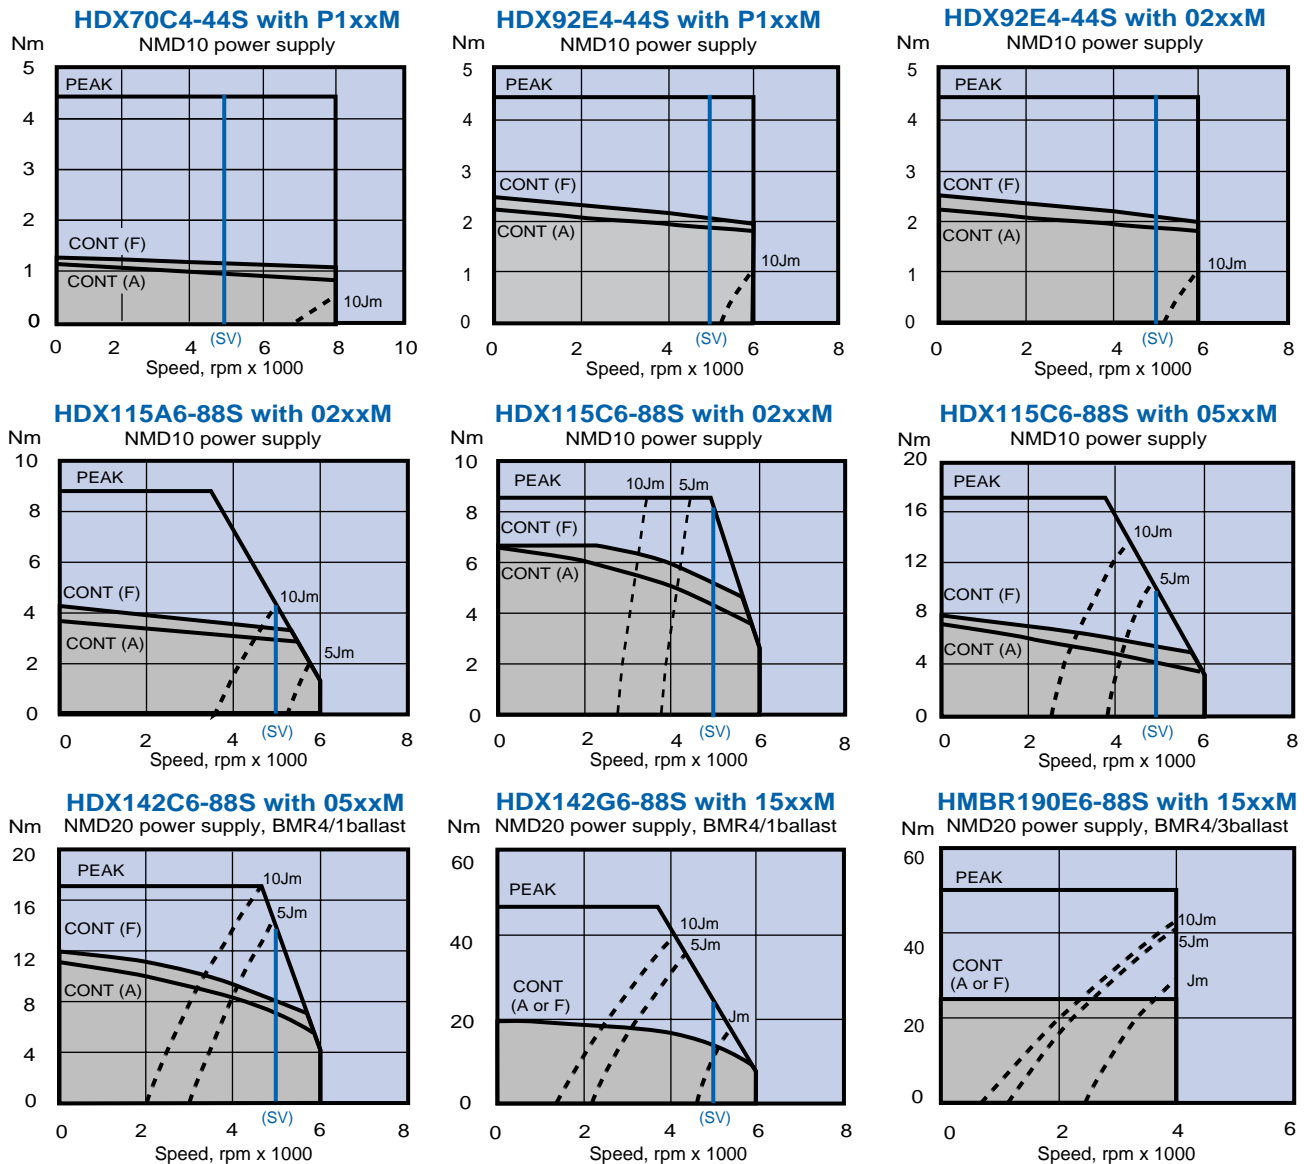

HBMR190

Length code	C	E	G	J
Dimension A (mm)	375	415	455	495
Cont. torque (Nm)	24	36	48	60

Motor cable: MOK21
Resolver cable: REK14

- NOTES: 1) Continuous curves: (A) in free air, (F) flange mounted. $\Delta T = 110^{\circ}\text{C}$. J_m = motor inertia.
 2) When used with an SV-series drive, the maximum speed is limited to 5000 rpm as indicated by the blue line. The full speed range is available with Compax drives.

Holding brake data (24V DC type)

Motor type	Holding torque (Nm)	Brake inertia (kg-mm ²)	Brake current (A)
HDX55	1	1	0.29
HDX70	1 (2)	2 (4)	0.26 (0.35)
HDX92	5 (10)	13 (17)	0.5
HDX115	10 (13.5)	17 (17)	0.5
HDX142	18 (40)	200 (200)	1.0
HBMR190	50	940	1.6

Figures in brackets are for the high-torque version.

Radial shaft loading

The following table shows the maximum load at the stated speed for a load applied half way along the shaft, and is based on a service life of 30,000 hours. Avoid applying large radial loads near the end of the shaft.

Motor	speed (rpm)	load (N)
HDX55	8000	150
HDX92	6000	200
HDX142	6000	600
HDX70	8000	200
HDX115	6000	350
HBMR190	4000	1150
